I'm wondering how I can use Go in multiple projects. If I have multiple projects that will share some common code (may or may not be in the same repository), what is the best practice on how to use Go, and how to deal with code bloat when reusing code? A: Package management is one of the big features of Go, meaning that you can just drop that go code wherever you want and then just reference it where you need it. Your main project should not be a go package, that is you shouldn't have a code.go file or anything like that. What you do need is a main.go file, which has a package declaration, i.e. import "code". The go tool takes this code and automatically generates stubs, controllers, a model and a view file. Now you can create other packages (sub-projects) for other code you need to use, and start to create the models, controllers and views for them. When done, just create a go package for each one (sub-project), and then add them to your main project's code dependency. The go tool will then automatically generate stubs, controllers, models and views for them. You can then use this generated code in your code, and you won't have to recompile all the code. The code will remain static. That said, the go tool is very smart and can compile them together if you tell it to, so you don't have to worry about bloat. If you are using git for version control, it's easy. Say you are developing

• Converting images from the wrong orientation (portrait and landscape) to the correct one (landscape and portrait). • Keep EXIF (exif) metadata while applying the conversion. • Preserve original image size, convert to another size (crop or resize). • Convert the orientation of multiple files at a time. • Convert the image as a watermark, as a graphic, as a frame or a selection from the image. • Convert to JPG, PNG, TIFF and more. • Automatic detection and conversion for common image formats. • Editable by hand the resulting EXIF orientation. • Apply the conversion to a complete folder. • Append EXIF in the resulting file. • Option to apply multiple orientation conversions at once. • Option to apply rotation correction using geotags. • Option to convert rotation from portrait to landscape, or vice-versa. • Option to convert the files into another image format. • Option to apply rotation correction for other image formats. • Option to apply the conversion to a whole folder. • Option to compress the files. • Option to apply other processing options, like noise reduction, adjustment, sharpening and more. • Option to save the resulting images in the output folder. • Option to show the progress of the process. • Option to hide the progress indicator. What's New in the?

ExifOrientationFix is a tool that aims to automatically correct the orientation of your images. If you are using images that you find in the format of 4:3, they will be automatically resized to 16:9, if this is the only requirement of the images. If you prefer to stay with 4:3, all you need to do is use the resize mode on the app and follow the prompts. Apart from that, it can also automatically rotate pictures from the wrong orientation to the correct one, even when the images have been saved in formats such as JPG, PNG, TIFF, among others. What's New: This version fixes a couple of bugs, as well as adds a bit of a new functionality to the app. System Requirements: OS: Windows 7, 8, 10 Howdy guys, I think you are searching for the latest ExifOrientationFix update to download.
