MIDI (Musical Instrument Digital Interface) is a standard developed by the MIDI Manufacturers Association. MIDI is intended to allow electronic instruments and computer programs to communicate with each other. For many of us, the first time we heard about it was when we started using the OS X Mavericks with Lion. So, what is this open source software actually is? What is a MIDI? MIDI stands for Musical Instrument Digital Interface, a specification for the communications between electronic musical instruments and computers. A MIDI compatible computer has to transmit a digital signal containing information on the various notes played by the instruments. Most probably you used a MIDI keyboard or mouse or a computer synthesizer before. The MIDI standard allows several different types of devices to be connected together by means of special MIDI cables or ports. You can connect instruments to a computer or a MIDI sequencer (track sequencer). Or you can connect a MIDI controller to a computer. An MIDI synthesizer allows you to play real sounds out of your computer. In summary, the MIDI standard enables the exchange of messages between musical instruments and computers. RWMidi Crack PC/Windows

RWMidi is a java class which provides static access to available MIDI input and output devices. Current version is RWMidi 1.0. A midi port is represented as a MidiDevice object. Methods to access available midi input devices and outputs are provided. Installation: The rwmidi.jar must be in the classpath. The midi-ipd.jar is a dummy jar containing classes which are not public or otherwise exported. You must copy rwmidi.jar and midi-ipd.jar to the same directory as rwmidi.jar. You may need to set a JAVA_HOME in the environment variables if you're not on a linux/java system. You may need to set a MIDI_IPD_HOME in the environment variables if you're not on a linux/java system. Usage: Input devices: - getInputDevices(): gets the list of available midi input devices (returns MidiDevice objects). Output devices: - getOutputDevices(): gets the list of available midi output devices (returns MidiDevice objects). - getOutputPort(int): gets a MidiDevice object which corresponds to the port specified. - openOutputPort(MidiDevice): opens the specified port (creates and returns a MidiDevice object). Note: RWMidi does not use a mapping of indices to midi devices. Rather, it uses a mapping of midi devices to indices, which can change between a call to the list the devices, and a call to open the devices. This means that index numbers are less useful with RWMidi than with other programs. One way to work around this is to keep track of the midi devices you create yourself in a data structure, rather than using a static variable. This allows you to use the index numbers, which are more useful and stable than using the returned devices. For example: // stores the list of midi devices created in an array ArrayList devices = new ArrayList(); //stores the index numbers for all available midi devices int[] indexNums = new int[devices.size()]; //opens the first midi device specified by the index number. MidiDevice device = devices.get(indexNums[0]);

RWMidi is a Java class that contains static methods that are designed to return information about a list of MIDI devices. This document contains a description of how to use RWMidi, followed by an example using RWMidi. Usual Usage: RWMidi is used by the MidiDevice to create a collection of methods that allow the client to get information about a list of MIDI devices. In the RWMidi class there are four static functions: getDevices(); The RWMidi::getDevices() method is used to list the available MIDI devices. This is a static function because it only needs to be called once. requestDevice(int index); The RWMidi::requestDevice() method is used to open a midi port connected to the specified index. This is a static function because it only needs to be called once. listDevices(); The RWMidi::listDevices() method is used to list the available MIDI devices. This is a static function because it only needs to be called once. requestPort(int index); The RWMidi::requestPort() method is used to open a midi port connected to the specified index. This is a static function because it only needs to be called once. RWMidi Example: RWMidiExample.java The RWMidiExample class contains a static method to show how to use RWMidi. The class contains the following method: package com.mycompany.mididemo; import com.mycompany.mididemo.RWMidi; import javax.sound.midi.*; public class RWMidiExample { public static void main(String[] args) throws Exception { // create a collection of MIDI devices RWMidi rwmidi = RWMidi.getDevices(); // example of using the MIDI device objects int midiDevice = rwmidi.requestDevice(7); System.out.println(rwmidi.getMidiDevices(7)); // example of using the MidiDevice objects MidiDevice device = rwmidi.getMidiDevice(midiDevice); System.out.println(device.getPortName()); System.out.println(device.getPortCount()); System.out.println(device.getInfo()); System.out.println(device.open()); // example of using the device indexes int outputDevice = rwmidi.requestDevice(1); int outputPort = rwmidi
